Diagnosing TB in clinical practice (including DR-TB)? Controversies, Innovation, and Challenges.

IFCC World Lab, Durban, 2017

Keertan Dheda, MB.BCh (Wits), FCP(SA), PhD (Lond), FRCP (Lond)

Professor and Head: Division of Pulmonology,

Department of Medicine, University of Cape Town

Conflict of interest statement: I have received speaker fees, grant funding, and/or free kits/ material from Hain Life Sciences, Alere Diagnostics, Clondiag, Orgenics, Qiagen (Cellestis), Protein Logic, Oxford Immunotec, Antrum Biotech, FIND Diagnostics, Boston Scientific, Nycomed Takeda, Novartis, Cipla, GSK, Astra Zeneca and SSI - however noneof these entities have played a role in study design or publication of data.

Overview

- TB or not TB? If TB, what is the resistance profile?
- Is the patient highly infectious? (contact tracing and infection control)
- Why does this patient have TB? (HIV, HbA1C, Cr, NCD)

- Diagnosis of LTBI (TST, IGRA and C-tb)

- NAAT (Gene Xpert MTB/ RIF; LPA; LAMP etc)
  - Retreatment cases; PPV
  - Contact tracing and infection control
  - Ultra cartridge

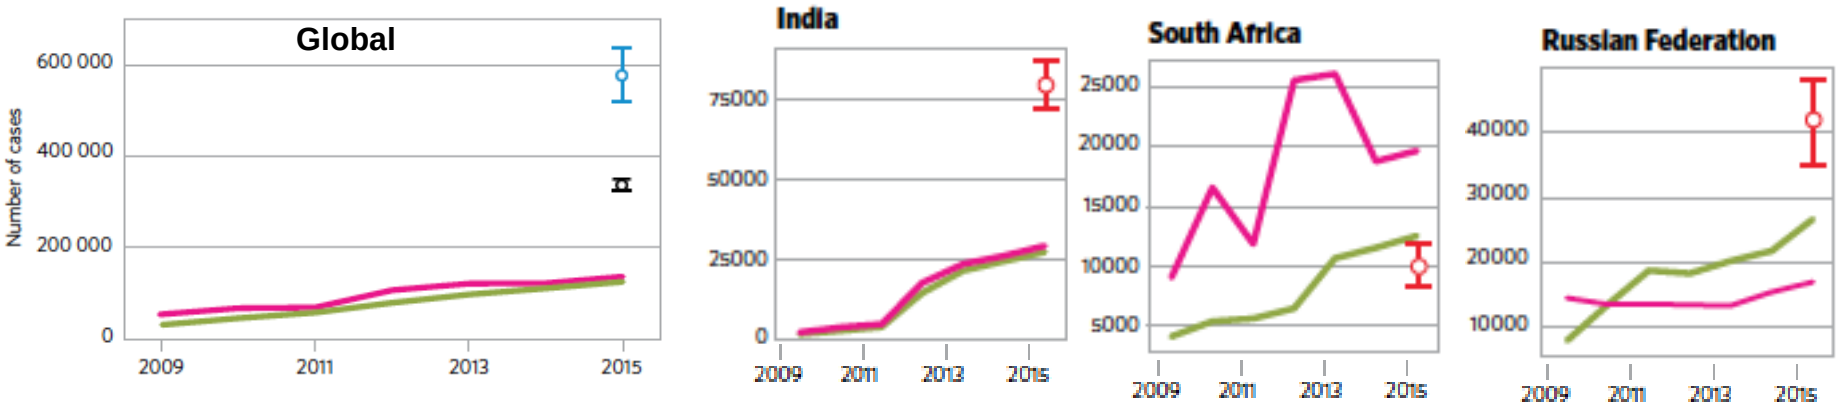
- WGS: implications for diagnostics & precision medicine

- Decentralising diagnostics to practice/ clinic or community: active case finding & triage tests

TB & drug-resistant TB: size of the problem

- TB top ID killer- 3 people die every minute! Over 1 billion people killed over the last 2 centuries!

- ~600 000 (540 000 to 664 000) MDR-TB (RR) cases globally in 2016 (~20% of TB deaths)



Global TB Report, WHO, 2016

- 2015: 51% of MDR-TB globally had resistance to either a FQ, a second-line injectable agent, or both
  (2017= 39% of those treated= FQ or SLID resistance)

- ~20% strains globally resistant to 1 major TB drug

Global TB Report, WHO, 2016

THE LANCET 2012

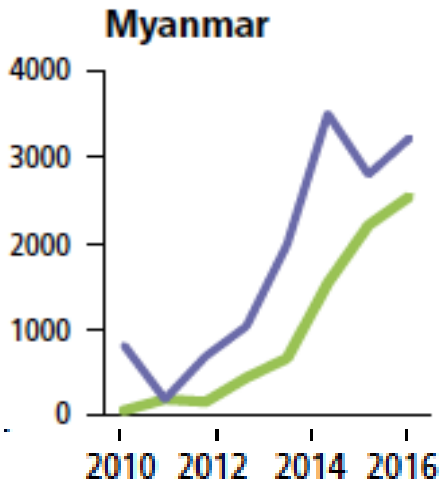
The global rise of extensively drug-resistant tuberculosis: is the time to bring back sanatoria now overdue?

Keertan Dheda, Giovanni B Migliori

Sondalo (1938) - 3500 beds

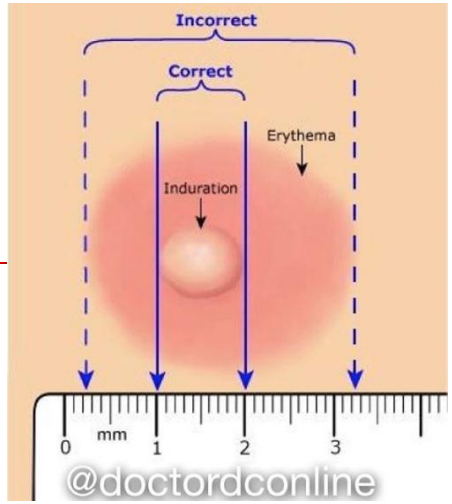
Myanmar (53 million: 45% in informal housing)

- Estimated burden in 2017: 191 000 cases [141-249]
  Incidence: 361/ 100 000 cases (9% HIV-infected)
  (estimated MDR-TB burden= 13 000 (5.1% new and 27% retreatment)
- 139 625 notified
  tested for R resistance= ~15% new and 63% of previous TB)
- Detected: 3213 MDR and 0 XDR
- Treated: 2537 and 5 XDR-TB
  (19.5 % of the total burden!!)



Global TB Report, WHO, 2017 (blue= detected; green= treated)

Diagnosis of LTBI



- TST
- T-SPOT-TB
  (post overnight ELISPOT assay)
- Quantiferon-TB Gold Plus
  (post overnight ELISA readout)

C-TB (ESAT-6 and CFP-10-specific skin test)

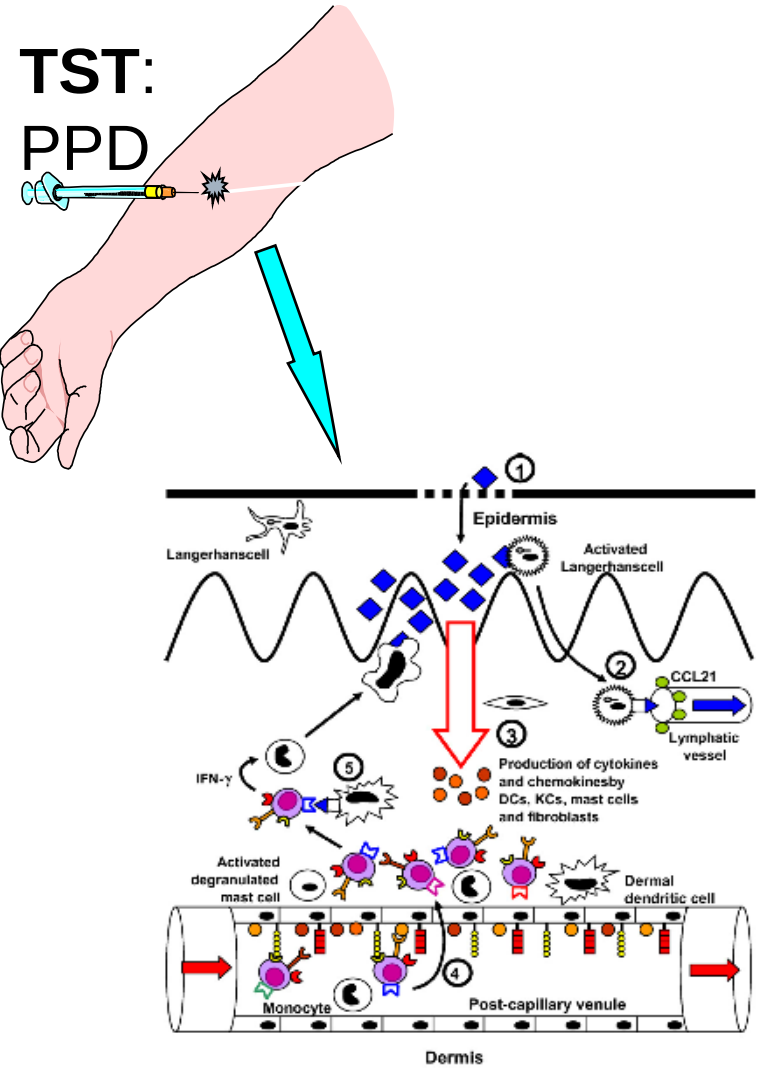
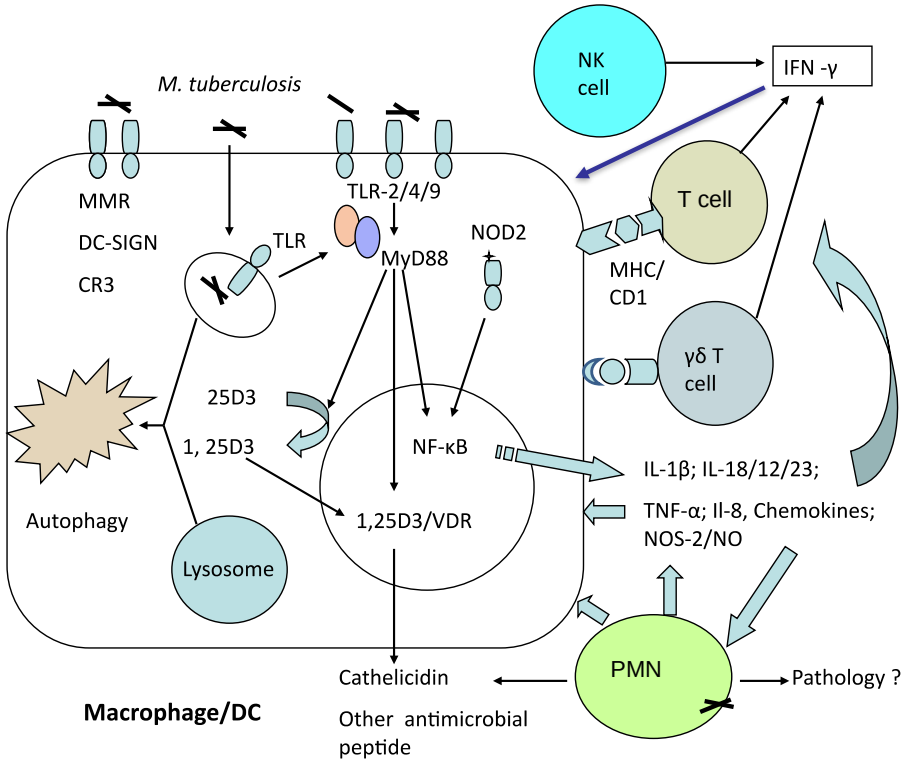
PPD



Vukmanovic-Stejic M, Imm Letters, 2006



Dheda K, Respirology, 2010

Indications in low burden settings: screening for LTBI where the risk benefit ratio is likely in favour of testing + treatment

- Contacts of infectious TB cases at risk
- Immuno-suppressive conditions: IMID (TNF), silicosis, HIV, post transplant, dialysis (TST + IGRA)
- Health care workers, prisoners, homeless, drug users
- Immigrants from TB endemic countries (risk stratify when older than 35 years; high incidence= > 150/ 100 000 cases)

Dheda K, Lancet, 2016

WHO guideline on LTBI, 2015

UK NICE guideline, 2016

Public Health England, 2016 (+ Migrant screening 2016)

ATS/ CDC 2000

Indications in high burden settings: screening for LTBI where the risk benefit ratio is likely in favour of testing + treatment

- HIV-infected persons and children under 5 years
- Contacts of infectious TB cases at risk: inform and advise (? CXR)
- Immuno-suppressive conditions: IMID (TNF), silicosis, post transplant, dialysis (TST + IGRA): cover with INH

Dheda K, Lancet, 2016

WHO guideline on LTBI, 2015

UK NICE guideline, 2016

Public Health England, 2016 (+ Migrant screening 2016)

ATS/ CDC 2000

Predictive value of test +ve TST versus +ve IGRAs in longitudinal studies (2 SRs)

PPV IGRA (recommended cut-point) = 2.10 to 2.7%
PPV TST (10mm cut-point) = 1.60 to 1.5%

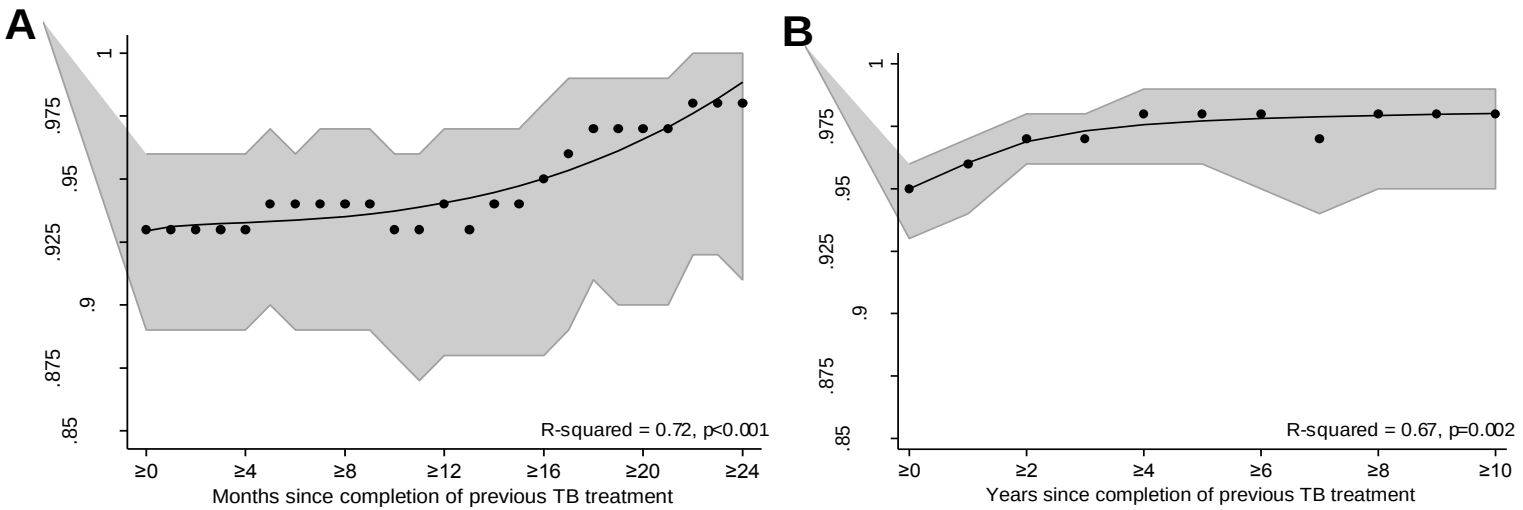
Xpert MTB/RIF Results in Patients With Previous Tuberculosis: Can We Distinguish True From False Positive Results?

Grant Theron,[1,2,a] Rouxjeane Venter,[2] Greg Calligaro,[1] Liezel Smith,[1] Jason Limberis,[1] Richard Meldau,[1] Duncan Chanda,[1,3] Aliasgar Esmail,[1] Jonny Peter,[1] and Keertan Dheda[1,4]

[1]Lung Infection and Immunity Unit, Division of Pulmonology and University of Cape Town Lung Institute, Department of Medicine, University of Cape Town, and [2]DST/NRF of Excellence for Biomedical Tuberculosis Research, and MRC Centre for Molecular and Cellular Biology, Division of Molecular Biology and Human Genetics, Faculty of Medicine and Health Sciences, Stellenbosch University, Tygerberg, South Africa; [3]Institute for Medical Research and Training, Lusaka, Zambia; and [4]Institute of Infectious Diseases and Molecular Medicine, University of Cape Town, South Africa

False positive Xpert MTB/RIF results in re-tested patients with previously confirmed tuberculosis



- Re-tested 238 Xpert +ve previously treated patients
- False-positivity rate (Xpert +ve, culture-negative) = 7% (16/238)

- Duration since the initial TB episode of ≤2 years rules in only 50% of false +ves
- Reclassifying “very low positive” to a “negative” result improved specificity [+3%(2-5%)] but reduced test sensitivity [-10%(4-15%)].

Infection control and contact tracing

- Negative PCR (e.g. Xpert) using a good sputum sample suggests no need for isolation (NPV of 99.7% for smear positivity)

Luetkemeyer AF, Clin Infect Dis, 2016

- Xpert bacterial load Readouts (Ct values correlate poorly with smear positivity)

The Use of An Automated Quantitative Polymerase Chain Reaction (Xpert *Mycobacterium tuberculosis*/RIF) to Predict the Sputum Smear Status of Tuberculosis Patients

REPORT FOR WHO

A multicentre non-inferiority diagnostic accuracy study of the Ultra assay compared to the Xpert MTB/RIF assay

Version 1.8 / February 2017

	Sensitivity (95%CI)				Specificity (95%CI)
	Pooled	Smear-negative	HIV-	HIV+	
Xpert	**82.9%** (78.8, 86.4)	**44.5%** (35.4, 53.9)	**89.3%** (83.1, 93.7)	**75.5%** (65.8, 83.6)	**98%** (96.8, 98.8)
Ultra	**87.8%** (84.2, 90.9)	**61.3%** (52, 70.1)	**90.6%** (84.7, 94.8)	**87.8%** (79.6, 93.5)	**94.8%** (93, 96.2)

17% improvement

Sensitivity of Xpert ULTRA compared to Xpert MTB/RIF in smear negative samples that are *M.tb* culture positive (n= 87)

Test performance with CIs and numbers	Xpert MTB/RIF	Xpert ULTRA	P-value
All Patients	63.4% (51.8, 73.7) 45/71	78.4% (68.4, 85.9) 65/83	P = 0.0496
HIV Un-infected	72.5% (54.3, 85.4) 21/29	85.4% (71.6, 93.2) 35/41	P = 0.2305
HIV Infected	57.2% (42.3, 70.9) 24/42	70.8% (55.6, 82.4) 29/41	P = 0.2548

+15%

+13%

+ 13%

- Xpert ULTRA cartridge
  - 2 amplification targets (IS6110 &1081)
  - Larger DNA reaction chamber
  - Addition of 'trace' detection readout
  - Improved fluidics and amplification
  - Melt curve analysis for RIF resistance
  - Ultra LOD is 15.6 CFU (vs 114 CFU for Xpert)

Esmail & Dheda, in preparation

Effect of empiric treatment

- **All RIF^R cases initiated on empiric MDR-TB Rx**
  - Suboptimal Rx of 30% [Pre-XDR (20%(FLQ^R or SLID^R) and XDR (10%)]
  - Suboptimal Rx of 70% MDR-TB

Limitations of existing technologies to predict resistance profiles: DR-TB

GXP gives RIF^R only
- No info on SL drugs

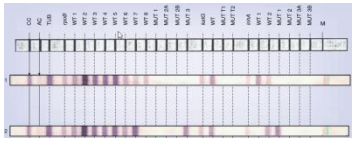
Xpert MTB/RIF

No reliable readouts for PZA & ETH
- In MDR: 60% PZA^R and 50% E^R

Long DST waiting times
- 2 to 3 mths SLIDs and FLQs

Phenotypic DST
MGIT liquid culture

Indeterminate results
- Up to 30% in SM -ve TB
- Readouts of 4 drugs
- contamination



Genotypic DST
Hain LPA - MTBDR*plus*
MTBDRs*l*

Inappropriate Rx initiated

POOR OUTCOMES + AMPLIFICATION OF RESISTANCE

We therefore need a full drug sensitivity profile at diagnosis

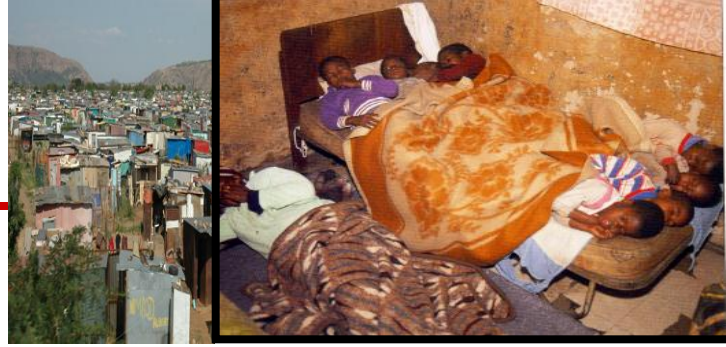
Summary



- Xpert – feasible if placed in a clinic but does not impact TB burden. Rule-in test. PPV. Re-treatment cases.
- **LTBI: PLHIV and children under 5 years (no TST needed)**
- **WGS (precision medicine)**: need to enable sequencing from sputum; more data needed about impact
- For real impact on burden need **ACF** and triage testing:
  ……major research challenge remains the development of a **low cost non-sputum-based screening test**
